

IKERLAN TECH OFFER FOR CLEAN h2 PROJECTS

IKERLAN, Luis Diaz
Research centre
Ldiaz@ikerlan.es, 943712400

Please send to cristina.garrido@cdti.es before 31st January

If necessary, presentations will be selected by the maturity of the project idea and its adequacy to the proposed topic

1. IKERLAN's capacities

Cooperative-based R&D center

+400 people

Mondragon Corporation

Basque Research & Technology Alliance

Combustion and burner design:

- Working on combustion (gas –including H2 blends-, liquid, solid biomass) for about 40 years
- Working on 100% H2 combustion for about 10 years
- Combustion CFD simulations for burner and appliance design
- Combustion lab, including H2 combustion
- Several projects for H2 burner development:
 - Domestic appliances (boilers, range tops...), including CFD, prototyping, testing and pre-certification, for clients like ORKLI, COPRECI, BSH
 - Industrial appliances, only at CFD level or lab-scale prototypes: heat treatment, secondary aluminium melting, industrial boilers

Other capacities (non-related to H2):

- Energy & Power Electronics
- Embedded systems, Cybersecurity, IA
- Mechatronics

2. Topics of interest in calls 2025

Topic	Experience and Contribution
<p>HORIZON-JU-CLEANH2-2025-01-06 Innovative hydrogen and solid carbon production from renewable gases/biogenic waste processes</p> <ul style="list-style-type: none">• Topic goal: H2 and C production from biogenic waste.• H2 produced can have impurities. High purity H2 is costly: some applications may not need such a purity.	<p>* Experience:</p> <ul style="list-style-type: none">• FP7NMP2-LA-2008-214395 H2SUSBUILD 2007-2014. http://www.h2susbuild.ntua.gr/ and many others (EU and national/regional). <p>* Contribution:</p> <ul style="list-style-type: none">• Depending on the technologies used to transform biogenic wastes/biogas/biomethane/renewable gases into hydrogen, this hydrogen can contain impurities. Purifying the gas can be costly, so, if at least for some applications H2 gas of lower purity is allowed, this can ease the fulfilling of the topic goals.• In case of burning the hydrogen, these impurities can negatively affect the applications, processes and products, i.e., can clog or prematurely degrade burners and components, promote harmful emissions, affect the quality of heat treated products, etc. IKERLAN can perform combustion calculations in order to address the combustion features of the gas obtained.• IKERLAN can also perform, in its Hydrogen Combustion Laboratory, experimental tests to assess the effects (mentioned above) of burning this "dirty" hydrogen, and then devise solutions to minimise or avoid them, and analyse whether these solutions are more cost effective than cleaning the gas at the production site. For this, we can develop experimental tests at small scale (tens of kW) in our lab.
